

**WE CLAIM:**

1. An apparatus for integrating a browser into and making it a part of a monitored and filtered data transmission to screen unwanted material comprising a browser means configured to require that substantially all pages be reviewed and checked before delivery to the recipient, said browser means creating varying degrees of accessibility to data in accordance with predetermined limits and criteria and being dynamically controlled to prevent the use of any other browser in conjunction with the system, a dynamic search engine to permit searching of data, a dynamic filter controlled by a central location to permit monitoring and filtering of the data transmitted and structuring of the infrastructure and a flagging filter component to scan messages and data prior to delivery.
